

1 Hitachi ID Login Manager

**Managing the User Lifecycle
Across On-Premises and
Cloud-Hosted Applications**

Automated application logins.

2 Login Manager Overview

Login Manager is an enterprise single signon (E-SSO) solution from Hitachi ID, which leverages password synchronization as an alternative to storing passwords:

- Hitachi ID Password Manager provides password quality, expiration, synchronization and reset.
- Login Manager automatically populates application login IDs and passwords for users.

Login Manager works on the assumption that users sign into Windows and into applications with the same password.

3 Login Manager Operation

- Users log into their workstation as before, using their network login ID and password.
- Login Manager installs a network provider, which picks up the user's primary ID and password.
- Login Manager monitors the applications that a user launches, watching for instances where the user retypes the primary ID and password.
- Login Manager stores the locations where the user reused his/her primary ID or password.
- When a familiar authentication prompt reappears, Login Manager automatically fills in the ID and/or password.
- Login Manager can read login ID aliases from an AD attribute at login time, eliminating the need to synchronize login IDs.
